**Exercise 6.1:** Let  $k$  be a field and  $A$  a vector space over  $k$ . Let  $I$  be a set and for any  $i \in I$  let  $B_i$  be a vector space over  $k$ .

1. Show that the tensor product commutes with direct sums:

$$\bigoplus_{i \in I} A \otimes_k B_i \cong A \otimes_k \left( \bigoplus_{i \in I} B_i \right)$$

2. (\*) Tensor products do not commute with direct products! Let  $k$  be a field,  $V$  a vector space over  $k$  and  $I$  a set. We denote by  $\text{Ens}(I, V)$  the vector space of maps  $I \rightarrow V$ .

- Show that  $\prod_{i \in I} V = \text{Ens}(I, V)$
- Show that the canonical map

$$V \otimes_k \prod_{i \in I} k \cong V \otimes_k \text{Ens}(I, k) \rightarrow \text{Ens}(I, V)$$

defined by  $v \otimes \phi \mapsto (i \mapsto \phi(i)v)$  is not an isomorphism.

Hint: All the maps in the image are contained in a finite dimensional subspace of  $V$ .

**Exercise 6.2:** Let  $G$  be a group and let  $V, W$  be representations of  $G$  over  $k$  with  $W$  of dimension  $n$ . Then  $V \otimes_k W$  is simple if and only if  $V$  is simple.

**Exercise 6.3:** Let  $k$  be a field with  $\text{char}(k) \neq 2$  and  $V$  a finite dimensional vector space over  $k$ . We have the following two subspaces of  $V \otimes V$ .

$$\Lambda^2 V = \langle v \otimes w - w \otimes v \mid v, w \in V \rangle \text{ and } S^2 V = \langle v \otimes w + w \otimes v \mid v, w \in V \rangle.$$

1. Compute the dimension of these subspaces and show that we have  $V \otimes V = \Lambda^2 V \oplus S^2 V$ .
2. Let  $G$  a group and  $V$  be a  $G$  representation over  $k$ . Show that  $\Lambda^2 V$  and  $S^2 V$  are subrepresentations of  $V \otimes V$ . In particular, if  $\dim_k V \geq 2$ , then  $V \otimes V$  is not simple as a  $G$ -representation.
3. Show the following formulas for the character.

$$\chi_{\Lambda^2 V}(g) = \frac{\chi_V(g)^2 - \chi_V(g^2)}{2} \text{ and } \chi_{S^2 V}(g) = \frac{\chi_V(g)^2 + \chi_V(g^2)}{2}$$

4. Let  $G = S_4$  and let  $W$  the standard representation of  $S_4$  (i.e. the 3-dim. irreducible representation contained in  $\mathbb{C}^4$ ). Show that  $\Lambda^2 V$  is irreducible.

(Note: this is actually true for any  $n \geq 1$  and any exterior power  $\Lambda^k V$  of the standard representation!)

**Exercise 6.4:** Let  $A$  be a  $k$ -algebra with a coassociative comultiplication  $\Delta$ . A morphism of  $k$ -algebras  $\epsilon : A \rightarrow k$  is called a *counit* if  $(Id_A \otimes \epsilon) \circ \Delta = Id_A = (\epsilon \otimes Id_A) \circ \Delta$ , i.e. if the following diagram commutes

$$\begin{array}{ccc}
 A & \xrightarrow{\Delta} & A \otimes A \\
 \Delta \downarrow & \searrow Id_A & \downarrow \epsilon \otimes Id_A \\
 A \otimes A & \xrightarrow{Id_A \otimes \epsilon} & A \otimes k \cong A \cong k \otimes A
 \end{array}$$

(Note: If  $\epsilon$  is a counit, it induces a structure of  $A$ -module on  $k$ . The commutativity of the diagram implies that for any  $A$ -module  $V$ , we have  $V \otimes k \cong V \cong k \otimes V$  as  $A$ -modules)

Let  $G$  be a group and  $A = kG$ . Show that

$$\epsilon : kG \rightarrow k$$

defined by  $\epsilon(g) = 1$  for all  $g \in G$  is a counit of  $kG$ .
